Internet of Things – simple solutions lead to great gains

Internet of Things is one of the biggest IT-trends today. It involves connecting data, sensors, devices and systems in real-time and in a way that optimizes the use of already existing information to obtain a competitive advantage.

Are you considering how your company could be using Internet of Things, but are not certain where to start?

Do you believe that your organization could use Internet of Things to optimize processes, gain greater data insight and make the most of a mobile workplace?

And are you concerned that it might be too complex, too expensive, require too many changes and resources to realize?

In a world with more devices than people and where leading analysts expect billions of devices will be connected through the Internet of Things within the next decade, it is a concept that every company and organization should consider sooner rather than later. Regardless of size and industry.

Get a head start at Internet of Things

Making the most of the Internet of Things does not necessarily require a comprehensive strategic IT project, where the entire organization is equipped and transformed with new devices, sensors and data. Or where considerable time and resources must be allocated.

Simply start with an off-the-shelf Internet of Things pack, consisting of a few sensors, which can connect your data and devices in a small area of your company. This could be reception and meeting rooms, as these areas reflect other parts of the business, while providing an easy and secure platform to test Internet of Things before embarking

on a big project. Another suitable way to start small is to select one department, where you can set up sensors, visually assess the data trends and get an overview of the results.

Starting small and simple will help you understand how the technology works, so you can focus on the user benefits relevant to your organization and help you assess, where Internet of Things can optimize your processes. This is a step-by-step journey that evolves over time, and it is a low-risk way of gaining experiences before embarking on the large-scale projects, providing bigger transformations in the company.

Bluefragments – your Internet of Things partner

Bluefragments delivers mobile experiences that support the business goals and work intelligently across systems and devices. We develop line of business apps, offering users a rich and intuitive experience on their smartphone or tablet.

We offer Internet of Things solutions, where your systems, assets and devices are intelligently connected to give more benefits that you could possibly create yourself. We simplify complex processes and manage end-to-end mobility projects to help you save time and resources so you can focus on your core business.

We start small and make sure you reap the benefits before entering into large-scale projects. Bluefragments will lead the process from assessing the need to installing sensors and providing the visual output of the data in your company. Starting simple can get you the installation and initial output in less than two weeks.
